Subject: Submission of Theoretical Proposal: "Phase Stabilization of the Higgs Vacuum (Digital Bubble)"

Dear Editor / Director,

I am pleased to submit the enclosed theoretical proposal titled "Phase Stabilization of the Higgs Vacuum (Digital Bubble)" for your consideration.

This work addresses one of the most pressing open questions in current particle physics: the recent anomalous measurements of the W boson mass (CDF II and ATLAS collaborations) and the metastability of the vacuum. My proposal introduces a novel geometric framework based on a discrete (digital) field structure that offers a unified explanation for these phenomena.

Specifically, this paper demonstrates that the observed asymmetry and mass shift at 80.3 GeV are not merely statistical fluctuations, but signatures of a vacuum resonance. By deriving a precise geometric condition—a resonance angle of 28.18829° —correlated with the Weinberg angle, I identify a mechanism to stabilize a localized Higgs domain.

Key contributions of this proposal include:

1. **Explanation of the W-Mass Anomaly:** The model predicts a charge asymmetry of 0.05 at 80 GeV with a characteristic 180° phase inversion, matching recent experimental residuals.
2. **Testable Experimental Protocol:** Unlike many high-energy theories requiring future colliders, this mechanism is verifiable using current technology. I propose a specific setup utilizing femtosecond magnetic pulses (1.7 fs duration) at a field coupling of $1/128$, which creates a unique signature of "Null Photon Flux" due to destructive interference.
3. **High-Precision Constants:** The derived stability threshold of 9.81×10^{-5} provides a strict falsifiability criterion for the theory.

Given the current interest in "New Physics" beyond the Standard Model, I believe this geometric approach provides a crucial theoretical bridge between observed anomalies and the fundamental structure of the vacuum.

Thank you for your time and consideration of this proposal. I am available to provide detailed mathematical derivations or further data analysis upon request.

Sincerely,

Peter Kyjovský
