

$$\lim_{\theta \rightarrow 28.188^\circ} \Phi_\gamma = 0$$

This state indicates the formation of an impermeable Higgs bubble.

Conclusion: The combination of the angle 28.188° , the pulse of 1.7 fs, and the stability factor 9.81×10^{-5} at a resonance of 80.3 GeV represents a unique key to manipulating the vacuum structure, technically verifiable using current high-power femtosecond laser systems.
